The invention relates to isolated polynucleotide (I) and peptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The card gene mapping, and in recombinant production of (II). The complete are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical cisorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of and to produce other types of data and products dependent on DNA and amino acid sequences. Ass64197-AAS94564 represent novel human cid sequence data for this patent did not appear in the printed of sequence data for this patent did not appear in the printed of sequence obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1;

The clone was closed from a feetal kidney library. Amplification of DNA44176 occurs in various tumours, suggesting an association with tumour formation or growth. Antagonists (e.g. antibodies) directed against PRO347 may have use in cancer therapy. The invention identifies 14 genes (see AAX87254-67) that are amplified in the genome of tumour cells. Such amplification is expected to be associated with overexpression of the gene product and to contribute to tumorigenesis. The encoded proteins (see AAX60477-90) may be useful targets for the diagnosis and/or treatment (including prevention)

transmembrane proteins used therapeutically. The PRO proteins have cytostatic, anti-inflammatory, anti-proliferative and immunosuppressive activity. The proteins and polynucleotides can be used in therapy, identification of homologues, raising antibodies and design of probes and primers. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement proteins may be used in inflammatory responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes nucleic acids encoding PRO secreted and

                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes a novel human polypeptide. The specification describes novel polypeptides designated PRO201, PRO292, PRO327, PRO1026, PRO344, PRO343, PRO347, PRO1015, PRO1017, PRO1012, PRO509, PRO863 and PRO8082. These genes are amplified in the genome of tumour cells. The polypeptides are believed to contribute to tumourigenesis. The polypeptides are useful target for the identification of certain cancers, and may act as predictors of the prognosis of tumour treatment. Antibodies against these polypeptides are useful in the treatment, and diagnosis of neoplastic cell growth

New human nucleic acids encoding secreted and transmembrane polypeptides, designated as PRO polypeptides, useful as pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polypeptides which are designated as PRO polypeptides are described. The membrane-bound proteins have various industrial applications, including as pharmaceutical and diagnostic agents. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources.

The present sequence is a cDNA identified in Incyte clone 998626 derived from KIDNTUT01 cDNA library. It encodes human protease and associated protein-9 (PPRG-9), which is expressed in urologic and musculoskeletal tissues. Anti-PPRG antibodies can be used as therapeutic antagonists, reagents for diagnosis and monitoring diseases and for isolating PPRG. PPRG nucleotide sequence can be used as probe or primer for diagnosis and monitoring of PPRG-related diseases and gene mapping. PPRG can be used in the treatment of cell proliferative disorders like cancer, arteriosclerosis, atherosclerosis, bursitis, cirrhosis and hepatitis, and immune disorders like AIDS, Addison's disease, adult respiratory distress syndrome, allergies,
New human proteases, useful for diagnosis, treatment and prevention of cell proliferative disorders such as atherosclerosis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques of crestore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polypuncleotide sequences have applications in classonsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and animan activity of the produce other types of data and products dependent on DNA and animance of the contract of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ·,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; T139 polypeptide; immune system disorder; spermatogenesis; ss; sperm-egg fusion; testicular disorder; testicular cancer; gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 GAGAGIIICITGCICCICICCCIGCACACCGCCIGCGAGCIGGGICCAGCCCCCTGCG 120

This represents the coding sequence of the human T139 polypeptide. The T139 polypeptide can be expressed by standard recombinant methodology.
THE T139 cDNA insert is deposited with APCC under accession number.
98684. The T139 polypeptides and polynucleotides can be administered therapeutically or prophylactically to treat/prevent disorders, associated with aberrant T139 expression or activity, especially proliferative or differentiative disorders, e.g. of the immune system. They can be used to differentiative disorders e.g. of the immune system. They can be used to spermatogenesis, e.g. of the immune system. They can be used to spermatogenesis or to treat disorders related to defects in sperm-egg fusion. They may also be useful to treat testicular disorders e.g. testicular cancer. The polypeptides may be used to identify selectively brinding compounds which may be useful for detecting the polypeptides in samples; and identifying compounds modulating polypeptide activity. The polyprucleotides are useful for producing probes or primers that conficulating the polynucleotides in a sample, gene mapping; identifying cells or tissues expressing aberrant T139 levels; determining if a gene cells or tissues expressing aberrant T139 levels; determining and to monitor therapeutic interventions; and for producing antisense sequences for therapeutic interventions; and for producing antisense sequences for therapeutic administration to modulate/prevent T139 expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GAGAGITICITGCTCCTCCCTGCACAACCGCCTGCGCAGCTGGGTCCAGCCCCTGCG 120

The present sequence is human protein with hydrophobic domain encoding count clone HP10760. The polynucleotide and polypeptide of the invention may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The polynucleotides associated with inappropriate polypeptide expression. The polynucleotides into a host cell and culturing the cell to express the protein. The polynucleotides and its complementary sequences may also be used as DNA probes in diagnostic assays and also used in gene therapy. The polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators of polypeptide expression and activity. The polypeptides and nucleic acids may be used as nutritional culturing the immune stimulation or suppression (e.g. for the treatment of microbial infections and autoimmune disorders such as multiple sclerosis, rheumatoid arthritis and insulin-dependent diabetes), to modulate controlling contraction's disease and Alzhaimer's disease), to modulate activin and inhibin activity (e.g. for controlling

expressed by standard recombinant methodology. The T139 cDNA insert is deposited with ATCC under accession number 98694. The T139 polypeptides and polynucleotides can be administered therapeutically or prophylactically to treat/prevent disorders associated with aberrant T139 prophylactically to treat/prevent disorders associated with aberrant T139 expression or activity, especially proliferative or differentiative disorders, e.g. of the immune system. They can be used to modulate spermatogenesis, e.g. as a contraceptive to decrease spermatogenesis or to treat testicular disorders e.g. testicular cancer. The be useful to treat testicular disorders e.g. testicular cancer. The polypebtides may be used to identify selectively binding compounds which may be useful for detecting the polypeptides in samples; and identifying compounds modulating probes or primers that selectively hybridize to the compounds confice or produciocides which may be useful for detecting the polynucleotides in a sample, gene mapping; identifying cells or tissues expressing aberrant dentify subjects at risk for or having a disorder associated with T139 expression or activity and to monitor therapeutic interventions; and for prevent T139 expression.

The invention relates to nucleic acids encoding a variety of proteins human T139 (TANGO-125), T125 (TANGO-125), T110 (TANGO-110), murine T175 crumurine WDNM-2, having diagnostic, preventive, (TANGO-175), human T175 or murine WDNM-2, having diagnostic, preventive, the control of the invention has the ability to modulate coll-cell interactions, to inhibit a proteinase activity, to modulate coll-cell interactions, contrologies and thea ability to modulate coll-cell interactions, polynucleotide of the invention are useful for diagnosting and treating disorder characterised by their aberrant expression or activity. The callular processes e.g. cell proliferation and/or cell differentiation. TANGO-139 is useful in wound healing and for treating variety of TANGO-135 is useful in wound healing and for treating cancer, are useful to treat pancreating cancer, are useful to treat pancreating disorders, such as the part disorders, such as useful to treat pancreatic disorders, such as some to the brain. TANGO-125, 110, 175 molecules treat disorders, e.g., creebrowscular disease, and tumours, and injury or trauma (c) the brain. TANGO-139, 125, 110, 175 molecules are useful to treat concertificated diseases and disorders, such as ischaemic heart disease. TANGO-139, 125, 110 and 175 molecules are useful to treat concertions and disorders, such as glomerulonephritis), TANGO-175 is useful to treat of sorders, such as glomerulonephritis), TANGO-175 is useful to treat concert of disorders, such as inflammatory diseases and disorders, inflammatory diseases and summune are useful for treating proliferative disorders, inflammatory diseases and disorders, inflammatory diseases and disorders, inflammatory diseases and summune are also disorders, inflammatory diseases and disorders, inflammatory diseases and disorders, inflammatory diseases and summune are also disorders, inflammatory diseases, remained t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel TANGO polypeptides and nucleic acid molecules useful as modulating agents in regulating cellular processes and for diagnosing and treating heart, liver, lung, kidney, inflammatory and cellular proliferative disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to 26 secreted human proteins. The proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers

                      proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess blodiversity and for nutritional purposes. The present sequence is a cDNA
            present invention provides the protein and coding sequences of novel

Claim 2; SEQ ID NO 290; 1380pp + sequence listing; English

```
The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the CDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 5'-end of a cDNA provided in the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

                                                                                                                                                                                                                                                                                                                              ö
                                                     clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length colors are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence was used as the representative sequence from a human clone which was used in homology searches to identify the clone.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                       61 GAGAGTTTCTTGCTCCTCTTCCCTGCACAACCGCCTGCGCAGCTGGGTCCAGCCCCCTGCG 120

The invention relates to primers for synthesising full length CDNA clones. 830 CDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5' and 3'-dends of the CDNA molecules have been determined. Primers for synthesising the full length CDNA are useful for clarifying the function of the protein encoded by the CDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   human cDNA of the invention.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       830 Primers useful for synthesizing full length cDNA clones and their use in genetic manipulation ^{\circ}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GAGAGITICITGCICCICICCCCGCACCGCCTGCGCAGCTGGGTCCAGCCCCCTGCG 120
